

HockeyShot

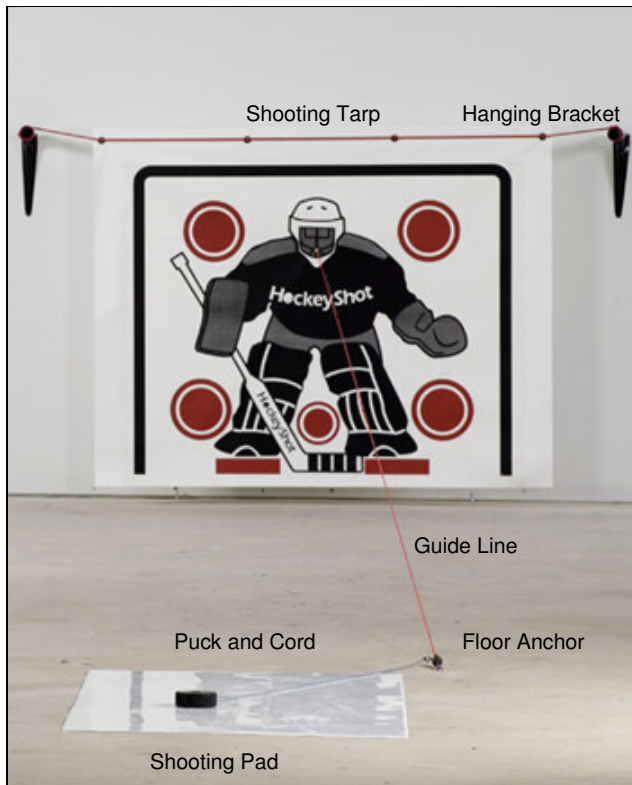

SHOOTING SYSTEM

JUNIOR TARP MODEL - Ages 6 - 13

HOW DOES IT WORK?

Although the Shooting System might seem like a complicated system, it is quite simple once understood. In a nutshell, the Shooting System consists of a puck, attached to a cord, attached to a guide line. The puck travels along the guide line, hits the shooting tarp, and is redirected back to the shooter with the help of the puck stopper. The puck cannot hit outside of the tarp area, which means no more damaged walls!

Puck-Attached to cord-Attached to guide line

HockeyShot Puck

The HockeyShot puck comes attached to a high quality long lasting nylon cord inside a plastic tubing. Its design allows the puck to rotate 360 degrees without tangling the cord. The puck also comes equipped with tack glides which allows better sliding on a concrete surface. The HockeyShot puck is a real standard puck.

Sliding Connector

The sliding connector allows the puck and cord to slide along the guide line. The sliding connector does not interfere with the travelling of the puck. The puck does not exceed the radius of the puck cord (when fully extended). Thus, the puck cannot hit outside of the shooting tarp area. No more damaged walls!

Guide Line

The guide line is anchored to the floor. A small hole must be drilled in the floor to insert a small screw. The guide line loops around the small screw.

Tarp Held by Hanging Brackets

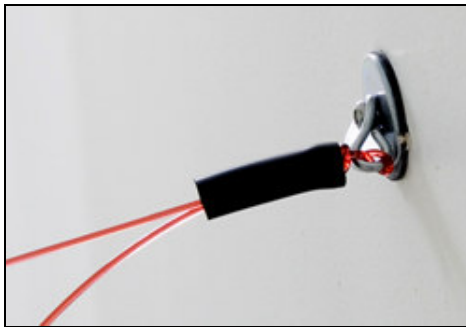

Puck Stopper Provides Puck rebound

The HockeyShot Shooting Tarp is suspended in the air by a bungee cord laced in the tarp, attached to 2 wall brackets. The 2 wall brackets are screwed in the wall studs. The puck stopper, which provides the puck rebound, is attached to the guide line 41 inches from the wall. When the sliding connector makes contact with the puck stopper, the puck has just enough length (because of the puck cord) to hit the tarp and the puck is redirected to the shooter. The puck cannot hit outside of the tarp area. NO MORE DAMAGED WALLS!

Guide Line Wall Anchor

Bungee Laced in Tarp

The shooting tarp is held onto the hanging brackets with a bungee cord.

The guide line is anchored in wall anchor.

FREQUENTLY ASKED QUESTIONS:

1) HOW DOES THE PUCK REBOUND BACK TO THE SHOOTER?

The puck is redirected to the shooter by the puck stopper attached to the guide line (not by the shooting tarp). When the puck is shot towards the tarp, the sliding connector makes contact with the puck stopper, giving just enough length for the puck to hit the tarp and be redirected to the shooter.

2) CAN THE PUCK HIT OUTSIDE OF THE TARP AREA?

The puck can only hit the shooting tarp. The puck cord is attached to the guide line (with the sliding connector) and the puck, when the sliding connector meets the puck stopper, only has enough cord length to hit the tarp. NO MORE DAMAGED WALLS!

3) HOW DOES THE PUCK AND CORD SLIDE ALONG THE GUIDE LINE?

The cord is connected to the guide line by the sliding connector. The sliding connector is designed to travel smoothly along the guide line. The sliding connector does not interfere with the puck.

4) HOW DOES THE TARP REMAIN SUSPENDED IN THE AIR?

The HockeyShot Shooting Tarp is suspended in the air by a bungee cord laced in the tarp, attached to 2 wall brackets. The 2 wall brackets are screwed in the wall studs.

5) HOW DURABLE ARE THE CORD AND GUIDE LINE?

The cord and guide line are made from top quality materials. The guide line is made from top quality fishing line and will last several years (an extra guide line comes with the Shooting System). The puck cord is made from top quality nylon materials and is covered by plastic tubing. The cord will last several months of heavy usage (5 extra cords come with the Shooting System).

6) DOES THE SHOOTING SYSTEM USE A REAL HOCKEY PUCK

Yes, the Shooting System uses a real standard hockey puck (same weight and size). The HockeyShot puck has 2 small holes in it (connected to the cord) and has glides on both sides to allow for better sliding on a concrete surface.

7) DOES THE SHOOTING SYSTEM IMPROVE SHOOTING SKILLS?

Yes, the Shooting System is a proven system. With over 1000 satisfied users from across Canada and USA, the Shooting System will help you develop a much more accurate and powerful shot. In 10-15 minutes, a player will take over 100 shots. The puck return directly to the shooter allows for an intense shot repetition. The targets provide instant feedback of where the shot hits, resulting in drastic shot accuracy improvement.

8) IS IT HARD TO ASSEMBLE THE SHOOTING SYSTEM?

The Shooting System is very easy to install. 2 small screws must be inserted into the floor (very small holes for the floor anchor). The 2 wall brackets are screwed against the wall studs. Total installation time is 30-60 minutes.

9) IF I AM NOT FULLY SATISFIED WITH THE SHOOTING SYSTEM, CAN I HAVE A REFUND?

All HockeyShot products come with a 30 day money back guarantee. If you are not satisfied with the Shooting System, simply return us the product and you will be fully credited for your purchase.
